

Saturn is So Cool
by Tessie Q. Malmstrom

Saturn is a very cool planet that is why I am writing about it. Did you know that Saturn is the 6th planet from the sun? Its planetary year is $29\frac{1}{2}$ years. The day length is 10 hours and 42 minutes. Its diameter is 72,367.4 miles. It is also cool for its 4 main groups of rings that make it an even more interesting planet.

I also discovered that Saturn's origin of name is the Roman God of harvest. It was discovered by Galileo Galilei in 1610. It is so cool because two of its moons are named Atlas and Phoebe which are some of my friends in class. Other moons are Titan, Rhea, Dione and Mimas. So that is why I picked Saturn for my essay.
